

4 Steps to Achieve Net Zero Carbon & beyond

- 1. Decarbonize** - *don't burn fuels in your projects (this requires projects to go all electric)*
- 2. Minimize** - *reduce the whole life carbon emissions as far as possible (includes embodied, refrigerant, operational and end of life emissions)*
- 3. Maximize** - *on-site energy production (examples include solar photovoltaic (PV) panels, passive solar, solar thermal & wind)*
- 4. Neutralize** - *design buildings and landscapes to sequester carbon then offset any remaining emissions (examples include Certified Emission Reduction (CER) and Verified Emission Reduction (VER) carbon credits)*
